Dear brand logo Hiring Team,

I am writing to express my strong interest in the CloudOps Engineer position within your R&D organization in Pune (remote, India). With 3+ years of experience building, maintaining, and operating CI/CD and build infrastructure for SaaS platforms, I am well positioned to accelerate developer velocity, improve build times, and deliver higher quality with each release.

My experience aligns closely with this role. I have hands-on expertise with Terraform infrastructure as code, Jenkins and GitHub Actions CI/CD pipelines, AWS cloud, Linux system administration, and Python/Bash automation for build tooling and operational runbooks. I monitor and troubleshoot infrastructure and service issues in AWS and Linux environments using Prometheus, Grafana, Loki, and Open Telemetry, and I apply SLIs/SLOs to track build reliability and performance. I am comfortable participating in on-call rotations (including US Eastern hours) and operating within agile/scrum workflows, contributing to planning, retrospectives, and continuous delivery.

I bring a performance-oriented mindset focused on decomposing long, complex builds into modular, component-based pipelines and relentlessly optimizing build times and reliability. I also create and maintain technical documentation and runbooks for operational processes, and collaborate across product engineering, support, and customer teams to resolve technical issues and improve system reliability.

I am confident my CloudOps/build engineering background, automation mindset, and focus on fast, safe, and consistent software delivery make me the right fit for this role.

I look forward to discussing how I can contribute to brand logo's R&D and build infrastructure team.

Best regards,
Ishwar Kalmegh
