Canonical — Golang Engineer (Requisition ID: 1087)
Remote / Worldwide

Dear Canonical Hiring Team,

I am writing to apply for the **Golang Engineer** role. I have spent 3+ years building and operating production software on Linux — most recently working primarily in **Go** — and I am applying because your team is where I would most like to keep doing exactly that: writing concurrent, well-tested systems where performance and security are the primary design constraints rather than afterthoughts.

In my current role at Techsurvi Pvt. Ltd. I build backend services and the platform around them. A recent piece of work was a concurrent Go service built on goroutines, channels, mutexes, and WaitGroups, which I profiled with pprof and tuned for goroutine and memory behaviour; it raised service availability by 60%. Around it I run CI/CD with Docker, Docker Swarm, and GitHub Actions on Ubuntu hosts, and I operate the observability stack — Prometheus, Grafana, Loki, Promtail, Node Exporter, and cAdvisor — that tells us when the system degrades. At Skyfunnel.ai I built a concurrent Go email validation service using worker pools (reducing backend load by 30%) alongside production backend services and REST APIs on PostgreSQL, and I resolved over 100 production issues, cutting resolution time by 40%. My independent Go work includes an RSS scraper using Chi, PostgreSQL, Goose migrations, and sqlc for type-safe SQL, as well as a game engine built on Ebiten.

Several things draw me to Canonical specifically. Your commitment to Go for systems where performance and security matter is the reason I work in the language. Ubuntu is the platform I already build and operate on daily, so the systems-level expectation in the role — rather than being a departure for me — is the environment I am already comfortable in. And the opportunity to work on distributed systems, on the tooling that delivers Ubuntu to the world, and on open source that people genuinely depend on, is exactly the kind of work I want to grow into. I would also welcome the openness the role describes: being matched to the product team that best fits my interests after the first round.

I recognise that Canonical's bar is exceptional, and I would rather earn it than assume it. What I bring is strong fundamentals in Go and Linux, real production experience owning systems end to end including debugging and operations, a habit of writing tested and documented code, and genuine enthusiasm for the open-source community. I am a self-starter who delivers to schedule, I collaborate well in writing and in review, and I care deeply about doing things well rather than merely doing them quickly. I am comfortable working asynchronously in a fully distributed team and would be glad to travel to team events.

I would welcome the opportunity to discuss how I can contribute to Canonical's Go engineering. Thank you for your time and consideration.

Sincerely,

Ishwar Kalmegh
