Canonical — Ubuntu Cloud Field Engineer (Requisition ID: 522)
Home based · Worldwide

Dear Hiring Team,

I am writing to apply for the **Ubuntu Cloud Field Engineer** role. I have spent 3+ years deploying, operating, and automating Linux and cloud infrastructure, and I am applying because this role sits exactly where my strengths meet my curiosity: helping customers solve real problems with Linux, **Kubernetes**, and cloud, hands on and end to end.

My day-to-day centres on Python and Bash automation, Kubernetes and Docker, and AWS, built on practical Ubuntu and Debian system and networking skills across the stack from kernel to applications. At Techsurvi Pvt. Ltd. I deploy and operate backend services on AWS (EC2, VPC, S3, IAM, RDS, EKS), design the Kubernetes runtime and container images with Docker, and hold average API latency at 150 ms. I build CI/CD pipelines with Docker, Docker Swarm, and GitHub Actions that make releases repeatable and auditable, and I implement Linux monitoring with Prometheus, Grafana, Loki, Promtail, Node Exporter, and cAdvisor so degradation surfaces early rather than during an outage. Alongside that I write Python and Bash automation to provision, patch, and verify hosts and containers. At Skyfunnel.ai I debugged and resolved over 100 production issues, cutting resolution time by 40%, and hardened outbound delivery with exponential backoff retries. My independent work includes an RSS scraper with database migrations and type-safe SQL generation.

What draws me to Canonical is the chance to combine engineering with customer impact. This role values developers who solve customer problems through architecture, presentations, and training, and that is how I like to work: understand the problem, design something that fits, build and test it against reality, then hand it over cleanly so the next team can own it. I am comfortable presenting technical trade-offs to stakeholders, and I care just as much about the documentation and the handover as about the code, because that is what makes a solution durable. The remote-first, globally distributed setup suits me well, and I would be glad to travel for internal and external events.

I recognise Canonical sets a very high bar and that I would need to keep raising my game in areas such as OpenStack, Ceph, and Kubernetes operator development. That is precisely why I am applying. I am quick to learn new platforms, I bring solid Python, Linux, and networking fundamentals to build on, and I care about doing things well and on schedule rather than merely finishing. I enjoy coaching colleagues where I have insight, and I would welcome the chance to contribute to Canonical's cloud engineering team.

Thank you for your time and consideration. I would be glad to discuss how I can help.

Sincerely,

Ishwar Kalmegh
