27 October 2026

Dear Hiring Team,

I am applying for the Senior AI Engineer / Full-Stack Developer role at Cyient in Bengaluru. With 3+ years of experience building production AI and full-stack applications, I work at the point where Python services, LLM-powered agents, and real software integrations meet. I am drawn to this role because it asks for exactly that combination: agentic AI that does useful work, a dependable full-stack application around it, and APIs that connect the application to engineering tools and data.

At Techsurvi Pvt. Ltd. I design and build Python (FastAPI) microservices and REST APIs, containerise them with Docker, and ship them through GitHub Actions CI/CD. I have designed and shipped LLM agents with prompt engineering, tool calling, and RAG over team APIs, automating triage workflows and removing repetitive manual work. I integrated Amazon Bedrock-backed AI features with structured outputs and input validation, and built evaluation fixtures so quality could be measured before and after rollout rather than assumed. On the operations side I instrumented the platform with Prometheus, Grafana, and Loki, which is how I prefer to run anything that other people depend on.

At Skyfunnel.ai I developed production backend services and REST APIs using Python (FastAPI), tRPC, and PostgreSQL, and built React.js + TypeScript dashboards with reusable components for operations users. I resolved more than 100 production issues across frontend and backend components, reducing bug resolution time by 40%. Earlier, at Bizonance India Pvt. Ltd., I developed applications in React, Node.js, and PostgreSQL, migrated a legacy frontend to React for a 20% performance improvement, and integrated the PhonePe API with secure transaction handling.

The engineering-tool side is where I would grow fastest here. I have working exposure to CATIA V5 and 3D CAD modelling, including geometric data and interchange formats such as STEP, IGES, and IFC, and I am comfortable with spatial data structures and the logic of transforming a model programmatically. I have not treated CAD as a black box: I understand that the hard part is usually the model, the constraints, and the validation rules, not the file upload. I am confident picking up the SDKs, APIs, and CLI interfaces of tools such as AVEVA E3D, Tekla Structures, STAAD.Pro, or IDEA Statica, and I would work closely with your domain engineers to encode their rules correctly instead of approximating them.

What I bring beyond the stack is a way of working: clear service boundaries, code reviews that improve the change, tests around the risky paths, Docker and CI/CD as the default delivery route, and Agile collaboration with product owners, engineers, and QA. I use AI tools to move faster on implementation, testing, debugging, and documentation, but I review and verify the output myself. I would welcome the chance to discuss how I can help automate 3D modelling and structural validation workflows for your team. Thank you for your time and consideration.

Sincerely,
Ishwar Kalmegh
