28 October 2026 Requisition: 210799552

Application for Technology Support III — DevOps, SRE

Dear JPMorganChase Hiring Team,

I am excited to apply for the Technology Support III role within the Chief Technology Office. As a Site Reliability Engineer with 3+ years of experience building, troubleshooting, and maintaining production applications and cloud infrastructure, I bring a reliability-first approach to operational stability, availability, and performance.

In my current role, I support Node.js services on AWS and use Prometheus, Grafana, Loki, and host/container metrics to detect anomalies and investigate production issues. I developed a Go stress-testing application that improved availability by 60%, and I use Docker, GitHub Actions, Python, and Bash to support controlled delivery and repeatable operational workflows. Previously, I resolved more than 100 production issues while reducing resolution time by 40% and built retry mechanisms for more dependable message delivery.

My approach aligns strongly with your emphasis on ITIL-based incident, problem, and change management. I focus on clear escalation, root cause analysis, validated remediation, and practical improvements that prevent recurrence. For AI-assisted operations, I treat recommendations as decision support: outputs must be checked against operational evidence, sensitive data must be protected, and uncertain or high-risk actions must be escalated rather than executed blindly.

I would welcome the opportunity to bring this combination of SRE discipline, hybrid application and infrastructure troubleshooting, automation, and stakeholder communication to JPMorganChase. I am particularly motivated by the opportunity to strengthen critical application flows and contribute reusable operational best practices in a regulated enterprise environment.

Thank you for your consideration. I would be glad to discuss how my production reliability experience can support your team.

Sincerely,
Ishwar Kalmegh
