Dear NCR Voyix Recruiting Team,

I am applying for the **Software Engineer (I)** position. I have 3+ years of experience working across the full software development lifecycle in production environments, and I am applying directly — the resume, the links, and the code are all there for you to look at.

My day-to-day is building and maintaining services in **Go** and **Node.js/TypeScript**, with **React** on the front end. At Techsurvi Pvt. Ltd. I designed and developed backend services (**Express**, **GraphQL**) running on **AWS** at an average API latency of 150 ms, containerised with **Docker** and **Docker Swarm**, and deployed to **Kubernetes** through **GitHub Actions** and **Jenkins** pipelines. Alongside that I built a concurrent Go stress-testing service using goroutines, mutexes and wait groups, which improved availability by 60%.

The parts of the job I care about most are the ones that are easy to skip and expensive to get wrong. I write unit, integration and system tests as part of the change rather than after it. I take part in code review and try to leave the code better than I found it. When something breaks in production I dig in rather than around it — I resolved more than a hundred production issues at Skyfunnel.ai and cut resolution time by 40% through root-cause analysis. And I document technical designs and procedures, because the person who maintains the system is rarely the person who built it.

On cloud breadth I have hands-on **AWS**, **Azure**, and **GCP** experience. On fundamentals, my base is data structures, algorithms, object-oriented design, and concurrency — the Go services I have written lean on all four.

I also want to speak plainly about the AI requirement, because I think it is the most interesting line in the posting. I use AI to write code, generate tests, and work through unfamiliar code faster, and I treat the output as a first draft: I read it, I check it against the codebase conventions, and I run the tests before it goes anywhere near review. That discipline matters more than the tooling. I have also shipped real AI-powered features end to end, including a real-time voice assistant with streaming conversations and tool calling — so I know what it takes to move past a demo.

- **Languages:** Go, TypeScript, JavaScript, Python, SQL, Bash
- **Frontend:** React, Next.js, Tailwind CSS
- **Cloud & Containers:** AWS, Azure, GCP; Docker, Kubernetes, Docker Swarm
- **Delivery:** GitHub Actions, GitLab CI, Jenkins, GitHub, Agile, SDLC, TDD
- **Quality:** unit / integration / system testing, code review, defect resolution, technical documentation

Unified commerce is a genuinely interesting domain — payments, restaurants, and retail operations are full of hard edge cases, and I would like to work on problems that behave differently under load than anything I have built so far. I would welcome the chance to talk about the role and to walk through any of my code.

Thank you for your time and consideration.
