Notion — Software Engineer, Early Career

San Francisco, California

Dear Notion Hiring Team,

I am writing to apply for the Software Engineer, Early Career role. I build user-facing products across the React, TypeScript, and Node.js stack with PostgreSQL, and I care about the same things your posting emphasises: taking features from conception to launch, improving the performance and reliability of experiences real people depend on, and choosing tools for the impact they deliver rather than the ones that trend.

In my current role at Techsurvi Pvt. Ltd. I designed and shipped the backend architecture of a Node.js (Express, GraphQL) application running on AWS, holding average API latency at 150 ms as usage grew. I pair that with Prometheus, Grafana, Loki, Promtail, Node Exporter, and cAdvisor so regressions surface before users report them, and with Docker and GitHub Actions pipelines that give the team a safe, repeatable path from commit to production. Earlier at Skyfunnel.ai I built a concurrent Go email validation service that cut backend load by 30%, and I debugged and resolved over 100 production issues, reducing resolution time by 40% through systematic root cause analysis and shared write-ups. Before that I worked across React, Node.js, and PostgreSQL full stack, including a React and Tailwind CSS migration that improved performance by 20%. My independent work includes a real-time AI voice assistant built with Next.js and Supabase.

On AI, I use tools like Cursor and Claude Code as genuine collaborators rather than as novelty. I use them to think through design options, to write and review code faster, and to leave behind work that is easier for the next person to pick up, because that last part is the point. I still read and reason about the code myself, and I have deliberately kept my fundamentals in data structures, algorithms, and concurrent systems sharp enough to be useful in a review, not just to ship.

What draws me to Notion specifically is the ambition of the problem. Building a collaborative workspace where teams and agents think together is a genuinely hard design problem, and the fact that Notinos are customer zero means engineers here see the consequences of their decisions immediately. I want to work somewhere craft matters, where shipping quickly and building things that last are treated as the same goal, and where a thoughtful tradeoff is valued more than a clever trick.

I would be glad to relocate to San Francisco for this role. I am comfortable working across design, product, and engineering to ship something end to end, I communicate clearly about progress and blockers rather than waiting to be asked, and I would welcome the chance to help whichever team the recruiter thinks I would make the highest impact on.

Thank you for your time and consideration. I would love to discuss how I can contribute to Notion.

Sincerely,

Ishwar Kalmegh
