30 October 2026 Tech Infra & IT Team, PhonePe Limited Application for Site Reliability Engineer - On-Prem Dear Hiring Team, I am applying for the Site Reliability Engineer - On-Prem role. As a reliability-focused engineer with 3+ years of experience administering Linux systems, automating infrastructure, and operating production services, I am drawn to the challenge of keeping one of the world's largest fintech platforms always up and always available. My work centres on Linux/Unix administration, networking, and automation. I have administered Linux hosts and network policies using IP, iptables, and IPsec, containerized services with Docker and Docker Swarm, and automated builds and releases through GitHub Actions and SaltStack-style configuration management. I have designed backend services in Go and Node.js with roughly 150 ms average API latency, built a concurrent Go stress-testing application that improved availability by 60%, and resolved more than 100 production issues, cutting resolution time by 40%. I also work with MySQL and MariaDB data stores, monitoring with Prometheus, Grafana, and Loki, and private-cloud style deployments using KVM/QEMU virtualization. I am comfortable participating in on-call rotations, triaging incidents, and communicating clearly in English across engineering teams. I script operational work in Python, Go, and Perl, and I value pragmatic automation, strong Linux networking fundamentals, and careful change management in data-center environments. For PhonePe, I would focus on hardening Linux and network configurations, automating repetitive operations with SaltStack, improving observability and alerting, and supporting MySQL/MariaDB and Aerospike-backed services with solid backup and failover practices. I would welcome the chance to discuss how my experience can contribute to your on-prem reliability goals. Thank you for your consideration. Sincerely,
Ishwar Kalmegh
