Application for Golang Engineer

Dear Privacy Pillar Hiring Team,

I am excited to apply for the Golang Engineer role. As a backend engineer with 3+ years of experience building services, APIs, and cloud infrastructure, I am drawn to Privacy Pillar's mission of helping organizations build consumer-centric brands through transparent consent management.

My experience includes designing backend architecture for Node.js and Go services, building REST APIs, operating PostgreSQL-backed applications, and maintaining reliable delivery pipelines with Docker and GitHub Actions. I developed a concurrent Go stress-testing application that improved availability by 60%, resolved more than 100 production issues, and reduced bug resolution time by 40%. I also work with Go concurrency primitives, data structures, and performance-oriented service design.

I am comfortable building scalable microservices, integrating message-driven workflows, and writing optimized database queries with ORM frameworks. My approach emphasizes clean interfaces, maintainable service boundaries, robust error handling, and production readiness through monitoring, testing, and controlled deployments.

For Privacy Pillar, I would focus on building reliable Golang services for consent and data privacy workflows, with clear API contracts, durable PostgreSQL data models, and reusable patterns for microservices and messaging. I would be glad to discuss how my backend and Go experience can support your engineering goals.

Thank you for your consideration.

Sincerely,
Ishwar Kalmegh
