13 October 2026

Dear PwC Recruiting Team,

I am applying for the **Associate – AWS DevOps Engineer** position (IN_ Associate _ AWS Devops Engineer _One cloud_Advisory_Mumbai). With 3+ years of experience designing, implementing, and maintaining cloud infrastructure and CI/CD pipelines on **AWS**, I work across the full scope this role describes — from infrastructure as code to monitoring, security, and the documentation that makes it operable.

At Techsurvi Pvt. Ltd. I design, deploy, and manage scalable, secure, and highly available AWS infrastructure — EC2, VPC, S3, RDS, ELB/ALB, ECR, CloudFront, and Lambda — provisioned through **Terraform** and configured with **Ansible**. I build and continuously improve the CI/CD pipelines on **Jenkins** and **AWS CodePipeline**/**CodeBuild** that carry a change from commit to production: build, test, image scan, and deployment of **Docker** workloads to **Amazon ECS** and **Kubernetes** on **EKS**. I also implement the monitoring, logging, and alerting layer — **CloudWatch**, **CloudTrail**, **ELK**, **Prometheus**, and **Grafana** — which is what turns "we deployed it" into "we know it is healthy".

The security and networking side is a deliberate part of how I build, not an add-on at the end. I apply least-privilege IAM policies and roles, security groups and NACLs, and encryption both at rest and in transit, and I work fluently across VPC design, DNS, TCP/IP, VPN, and load balancers. On the automation side I script provisioning, configuration, and deployment in **Python** and **Bash**, and I keep the documentation current — infrastructure setup, CI/CD workflows, and operational procedures — because an advisory deliverable that nobody else can run is not finished.

Two things I particularly enjoy about this role: troubleshooting infrastructure and deployment issues promptly and fixing them for good, and collaborating with development teams to optimise deployment performance on AWS. That loop — build, automate, observe, fix, document — is the work I want to keep doing, and an advisory setting means doing it across problems rather than a single product.

- **AWS:** EC2, VPC, S3, IAM, ELB/ALB/NLB, RDS, CloudWatch, CloudTrail, Auto Scaling, Route 53, ECS, EKS, Lambda, API Gateway
- **IaC & Config:** Terraform, CloudFormation, AWS CDK, Ansible
- **CI/CD & Containers:** Jenkins, CodePipeline, CodeBuild, GitLab CI, CircleCI, Docker, Amazon ECS, Kubernetes
- **Scripting & Networking:** Python, Bash, PowerShell; DNS, TCP/IP, VPN, load balancers, security groups, NACLs

I would welcome the chance to discuss how I can contribute to the One cloud advisory team, and I am happy to walk through any part of the infrastructure I have built in detail.

Thank you for your time and consideration.
