Razorpay — Forward Deployed Engineer, Agent Studio
Bengaluru, India

Dear Razorpay Hiring Team,

I am writing to apply for the **Forward Deployed Engineer** role on Agent Studio. This is the shape of work I want: sitting close to a real business problem, finding the actual constraint behind the request, and having to build the working version myself rather than hand it to someone else. I have 3+ years shipping production software in Python and TypeScript, and I have owned technical relationships with customers and enterprise stakeholders directly — discovery, reconciling what the business owner and the operators each need into one spec, then delivering it end to end.

On the agent side, I build production LLM workflows rather than demos: prompt design, tool calling, and RAG over internal APIs, with eval fixtures and success metrics defined before rollout so I am measuring production outcomes instead of demo applause. I have shipped agents that automated triage work, instrumented them with **Prometheus** and Grafana, and iterated on real failure cases. I treat cost per run, latency, and observability as design constraints from the first line of code, because that is what the Agent Studio team is being asked to do for merchants at scale.

The integration side is where I have spent the most time. At Techsurvi Pvt. Ltd. I design and ship Node.js and TypeScript backends on AWS with a Kubernetes runtime, automate delivery through Docker and GitHub Actions, and instrument everything with Prometheus, Grafana, Loki, and Node Exporter. At Skyfunnel.ai I debugged and resolved over 100 production issues across services and third-party integrations, reducing resolution time by 40%, and hardened outbound integrations with webhooks and exponential backoff retries. Earlier I integrated the PhonePe payment API into a live fintech product, handling auth and transaction integrity on real payment flows — so I know what it feels like when the failure mode is someone's money rather than a slow page.

Two things I want to say plainly. First, I prefer ambiguous, high-context problems to clean tickets; sitting inside a merchant's real workflow until I understand what actually happens when it fails is the part I enjoy, not the part I would avoid. Second, I care about the field-to-platform loop. The patterns I see repeatedly in customer work are exactly the signal Agent Studio should turn into reusable connectors, templates, and eval packs, and I would like to be the person carrying that signal back to the platform team.

Razorpay's values — customer first, autonomy and ownership, transparency, challenging the status quo — describe how I already work. I am based in India and would be glad to be in the Bengaluru office. I would welcome the chance to sit with a merchant, find the real problem, and go build it.

Thank you for your time and consideration. I would love to discuss how I can contribute to Agent Studio.

Sincerely,

Ishwar Kalmegh
