27 October 2026

Dear Hiring Team,

I am applying for the Senior Software Engineer (Python Full Stack) role in Pune. With 3+ years of experience building and maintaining scalable, secure web applications end to end, I work across Python backend services and React.js frontends and I am comfortable owning a feature from data model and API design through to the interface users see. The combination this role describes — Python (FastAPI), React.js, AWS (EC2, SNS, EMR, Bedrock), and responsible use of AI tools — is the stack I have been building in, and I would like to bring that depth to your team.

At Techsurvi Pvt. Ltd. I designed and developed the backend architecture of a Node.js (Express, GraphQL) application on AWS (EC2, Lambda, RDS, ECR, CloudFront, S3), holding average API latency at 150 ms. Alongside that I built Python (FastAPI) microservices and REST APIs for business workflows, containerised them with Docker, and shipped them through GitHub Actions CI/CD. I integrated AWS SNS event notifications and Amazon Bedrock-backed AI features, including prompt design, structured outputs, and input validation, so model behaviour stayed predictable and safe in production. I also instrumented the platform with Prometheus, Grafana, Loki, Promtail, Node Exporter, and cAdvisor, which is how I prefer to operate: measure the service, not assume it.

Before that, at Skyfunnel.ai I developed production backend services and REST APIs using Python (FastAPI), tRPC, and PostgreSQL, and built React.js + TypeScript dashboards with reusable UI components for operations users. I resolved more than 100 production issues across frontend and backend components, reducing bug resolution time by 40%, and hardened WhatsApp and Email delivery with exponential backoff retries. At Bizonance India Pvt. Ltd. I developed applications in React, Node.js, and PostgreSQL, migrated a legacy frontend to React + Tailwind CSS for a 20% performance improvement, and integrated the PhonePe API with secure transaction handling.

What I would bring beyond the stack is a consistent way of working: OOP and clear service boundaries, code reviews that improve the change rather than just approve it, unit and integration tests around the risky paths, Docker and CI/CD as the default delivery path, and Agile collaboration with product owners, analysts, and QA. I use AI tools to move faster on implementation, tests, debugging, and documentation, but I review and verify the output myself — generated code I cannot explain does not ship. I also treat security and performance as design inputs, from validation and secrets handling to query and render-path optimisation.

I would welcome the chance to discuss how I can contribute to the applications your team is building. Thank you for your time and consideration.

Sincerely,

Ishwar Kalmegh
