Cloud Software Engineering Team

Application for Senior Software Engineer, Cloud Software Development

Dear Hiring Team,

I am applying for the Senior Software Engineer role in Cloud Software Development. As a cloud and backend engineer with 3+ years of experience building and operating production services, I am drawn to the opportunity to work on distributed systems that power vehicle, charging, and mobile platforms.

My work has centred on Go and Node.js services running on AWS. I have designed backend architecture that serves REST and GraphQL APIs at roughly 150 ms average latency, containerized services with Docker and Docker Swarm alongside Kubernetes deployment patterns, and automated build, test, and release through GitHub Actions. I built a concurrent Go stress-testing application using goroutines, mutexes, and wait groups that improved availability by 60%, and I have resolved more than 100 production issues, cutting bug resolution time by 40%. I also work with Kafka-style event flows, MongoDB and PostgreSQL data models, and Prometheus, Grafana, and Loki observability.

I use AI tools deliberately rather than casually: for design exploration, test generation, code review, debugging, and documentation, with human review as the gate before anything reaches production. I enjoy leading design discussions and code reviews, working closely with product, QA, and mobile partners, and taking ownership from design through production support.

For this team, I would focus on reliable Go services with clear API contracts, resilient event-driven integration, and observable Kubernetes deployments that stay healthy under real traffic. I would welcome the chance to discuss how my experience can contribute to your engineering goals.

Thank you for your consideration.

Sincerely,
Ishwar Kalmegh
