Application for Site Reliability Engineer II (Platform Engineer)

Dear SIXT Hiring Team,

I am excited to apply for the Platform Engineer role focused on Developer Experience & Agentic AI. As a Site Reliability Engineer with 3+ years of experience building developer tooling, cloud-native infrastructure, and production services, I am motivated by SIXT's goal of helping engineers move faster with less friction through reliable, AI-native workflows.

My background combines CI/CD, observability, AWS, Kubernetes, and backend system engineering. I work with GitHub Actions, Docker, Prometheus, Grafana, and Loki to support the build-ship-run lifecycle, while my Go and Node.js experience helps me understand the systems developers operate. I have improved availability by 60% through concurrent stress testing, reduced production issue resolution time by 40%, and built services that reduced backend load by 30%.

I am particularly drawn to the opportunity to build agents that perform real multi-step work rather than simply generate answers. My approach emphasizes focused tool interfaces, explicit state and memory, bounded autonomy, and integration with the workflows developers already use. For production operation, I prioritize task-based evaluations, secure credential scoping, human approval for consequential actions, complete audit trails, and reliable fallback and rollback paths.

At SIXT, I would bring this engineering discipline to agentic CI/CD and observability capabilities, working directly with developers to solve practical problems and turning successful prototypes into reusable platform services. I would focus on secure adoption across diverse teams, measurable reductions in operational friction, and the reliability standards required for a platform serving hundreds of engineers.

Thank you for your consideration. I would welcome the opportunity to discuss how I can help SIXT establish effective, production-ready AI-native engineering.

Sincerely,
Ishwar Kalmegh
