27 October 2026

Dear Hiring Team,

I am applying for the Middle DevSecOps Engineer role at Snoonu. With 3+ years of experience across DevOps and cloud infrastructure, I have spent that time securing and operating production systems on AWS rather than treating security as a separate review at the end. I am looking for a role where I can go deeper into cloud security while staying hands-on with the infrastructure, pipelines, and applications that the controls actually protect, and this position is that role.

At Techsurvi Pvt. Ltd. I hardened AWS accounts with least-privilege IAM roles and policies, security groups, NACLs, private endpoints, and VPC peering, and enabled GuardDuty, Security Hub, Inspector, Config, CloudTrail, and WAF for continuous detection and alerting. I automated remediation in Python (boto3) and Bash for public S3 buckets, overly broad IAM policies, unencrypted volumes, and stale access keys, routing findings into tickets so they were fixed rather than merely reported. I also built secure CI/CD with GitHub Actions, Terraform and CloudFormation, Docker image scanning, and secrets management, and secured REST and FastAPI services with OAuth2/JWT, input validation, rate limiting, dependency scanning, and container hardening. The platform runs on Docker with Prometheus, Grafana, Loki, and CloudTrail-backed visibility, so I know what it takes to keep both the security signal and the service healthy.

Before that, at Skyfunnel.ai I secured production backend services and REST APIs using Python (FastAPI), tRPC, and PostgreSQL, adding authentication, input validation, and rate limiting, and resolved more than 100 production issues across services and integrations. At Bizonance India Pvt. Ltd. I integrated the PhonePe API with secure transaction handling, input validation, and secrets management, and delivered React and Node.js applications on PostgreSQL. That mix of application and infrastructure work is useful in DevSecOps, because it is easier to make a control acceptable to engineers when you understand the code it touches.

I also have working knowledge of GCP security fundamentals, including IAM, VPC firewall rules, Cloud Audit Logs, and Security Command Center, and I am comfortable extending the same baseline across both clouds. I automate where it removes toil and reduces human error, I document what I build so another engineer can run it, and I prefer to agree on a risk-based priority with development and operations teams rather than block a release on a finding that does not warrant it. Snoonu's emphasis on ownership, curiosity, and shipping real work is the environment in which I do my best work.

I would welcome the chance to discuss how I can help harden Snoonu's cloud environment while keeping delivery fast. Thank you for your time and consideration.

Sincerely,

Ishwar Kalmegh
