30 October 2026 TransUnion GCC India Application for DevOps Engineer Dear Hiring Team, I am applying for the DevOps Engineer role supporting TransUnion's hybrid cloud platform. With 3+ years of experience operating high-availability systems on AWS, automating infrastructure, and maintaining CI/CD pipelines, I am excited about contributing to your cloud platform integration and SRE best practices. My work centres on AWS infrastructure, container orchestration, and observability. I have designed and operated services on EC2, EKS, Lambda, RDS, and S3, built CI/CD pipelines deploying to Kubernetes with Docker and GitHub Actions, and automated provisioning with Terraform and Ansible. I have implemented monitoring with Prometheus, Grafana, and Splunk, resolved more than 100 production issues, and reduced bug resolution time by 40%. I also have hands-on experience with secrets management, GitOps workflows, and compliance-oriented controls such as SOC-2 and ISO 27001. I am comfortable working in mission-critical environments, documenting systems and processes, and collaborating with development teams to streamline deployments. I script operational work in Python and Go, and I value incremental, low-risk changes during legacy-to-hybrid cloud migrations. For TransUnion, I would focus on reliable Terraform/Ansible automation, secure Kubernetes delivery, strong observability with Splunk and Grafana, and practical SRE improvements that enhance developer experience. I would welcome the chance to discuss how my experience can contribute to your platform goals. Thank you for your consideration. Sincerely,
Ishwar Kalmegh
