27 October 2026

Dear Hiring Team,

I am applying for the Azure Site Reliability Engineer (SRE) — SaaS Operations role in Bangalore. With 3+ years of experience in production operations and cloud infrastructure, I have worked across Microsoft Azure and AWS, with a strong Microsoft SQL Server background and PostgreSQL readiness for the upcoming database modernization. I am drawn to this role because it combines the parts of operations I do best: keeping a high-availability SaaS platform healthy, owning incidents through RCA, patching safely under change control, and automating the repeatable work so the team can focus on real problems.

At Techsurvi Pvt. Ltd. I maintain Azure infrastructure including VMs, storage, Azure Monitor, and Log Analytics alongside AWS services for production SaaS workloads, monitoring platform health, reviewing logs, and resolving availability and performance issues. I administer Microsoft SQL Server 2016+ across production and non-production environments, covering T-SQL investigations, indexing, query tuning, SQL jobs, stored procedures, backup/restore, and HA/DR. I support PostgreSQL readiness through backup/recovery, replication, performance tuning, and coexistence planning for the MSSQL-to-PostgreSQL migration, and I plan and execute SQL and Windows/Linux OS patching in controlled maintenance windows. I also automate operations with PowerShell and Python, support Terraform and Puppet, improve GitHub and Jenkins CI/CD, and tune alerts and dashboards.

Incident ownership is a core part of my work. I own P1/P2 triage, write and maintain runbooks, reproduce customer-reported issues, and escalate verified defects to engineering with logs, evidence, and impact analysis. I am used to a 24x7 on-call rotation and to communicating clearly with client and delivery stakeholders during an active incident, including what is known, what is not known, and what happens next. Before Techsurvi, at Skyfunnel.ai I supported production SaaS operations and incident triage across services, resolved more than 100 issues, and reduced bug resolution time by 40% through root cause analysis, while building Python (FastAPI) services and working with PostgreSQL, monitoring, alerting, and logging.

What I would bring to Zensar is operational discipline: patch plans that account for rollback and validation, documentation that another engineer can follow at 2 a.m., monitoring that surfaces a real problem instead of noise, and automation that is idempotent and tested. I am comfortable with rotating shifts and US time zone coverage, and I work well with database, platform, application, and support teams because I have been on both the application and infrastructure sides of an incident. I would welcome the chance to discuss how I can help improve the reliability and operational maturity of your SaaS platform. Thank you for your time and consideration.

Sincerely,

Ishwar Kalmegh
